ABSTRACT OF THE DISCLOSURE

1

2   An apparatus for manipulating a selectively encrypted data stream in a

3 manner consistent with certain embodiments has a filter that selects a set of

4 packets from the selectively encrypted data stream based upon packet identifier

5 values to produce a stream of packets having clear packets and encrypted packets.

6 A packet substituter inserts a clear version of the encrypted packets into the stream

7 of packets in place of the encrypted packets to produce a stream of clear data.

8 This abstract is not to be considered limiting, since other embodiments may deviate

9 from the features described in this abstract without departing from the invention.
